## 11. TOXICOLOGICAL INFORMATION

Acute	Toxicity:

Ingestion(oral), LD50(mg/kg):	>2500 (Rat) *
Dermal, LD50(mg/kg):	No data available
Inhalation, LC50(mg/l):	>5.09 (Rat,4hour) *(This was the highest attainable concentration.)
Eye irritation:	Non irritant (Rabbit) *
Skin irritation:	Non irritant (Rabbit) *
Skin sensitizer:	Non sensitizer (Guinea pig) *
Local Effects: soo Chronic Toxicity or	Long torm Toxicity

Local Effects: see Chronic Toxicity or Long term Toxicity

Chronic Toxicity or Long Term Toxicity:

Prolonged inhalation of excessive dust may cause lung damage. It is attributed to "lung overloading", a generic response to excessive amounts of any dust retained in the lungs for a prolonged interval. Use of this product, as intended, does not result in inhalation of excessive dust.

In a study in rats by chronic inhalation exposure to a typical toner, a mild to moderate degree of lung fibrosis was observed in 92% of rats in the high concentration(16mg/m<sup>3</sup>) exposure group, and a minimal to mild degree of fibrosis was noted in 22% of the animals in the middle(4mg/m<sup>3</sup>) exposure group. But no pulmonary change was reported in the lowest(1mg/m<sup>3</sup>) exposure group, the most relevant level to potential human exposures.

Carcinogenicity

The IARC reevaluated titanium dioxide as a Group 2B carcinogen (possible human carcinogen). In animal chronic inhalation studies, the tumor formulation observed in only rats with animal chronic inhalation study are attributed to "lung overloading", a generic response to excessive amounts of any dust retained in the lungs for a prolonged interval. Use of this product, as intended, dose not result in inhalation of excessive dust. Epidemiological study to date have not revealed any evidence of the relation between exposure to titanium dioxide and diseases of the respiratory tract beyond general effects of dust.
